This Talk

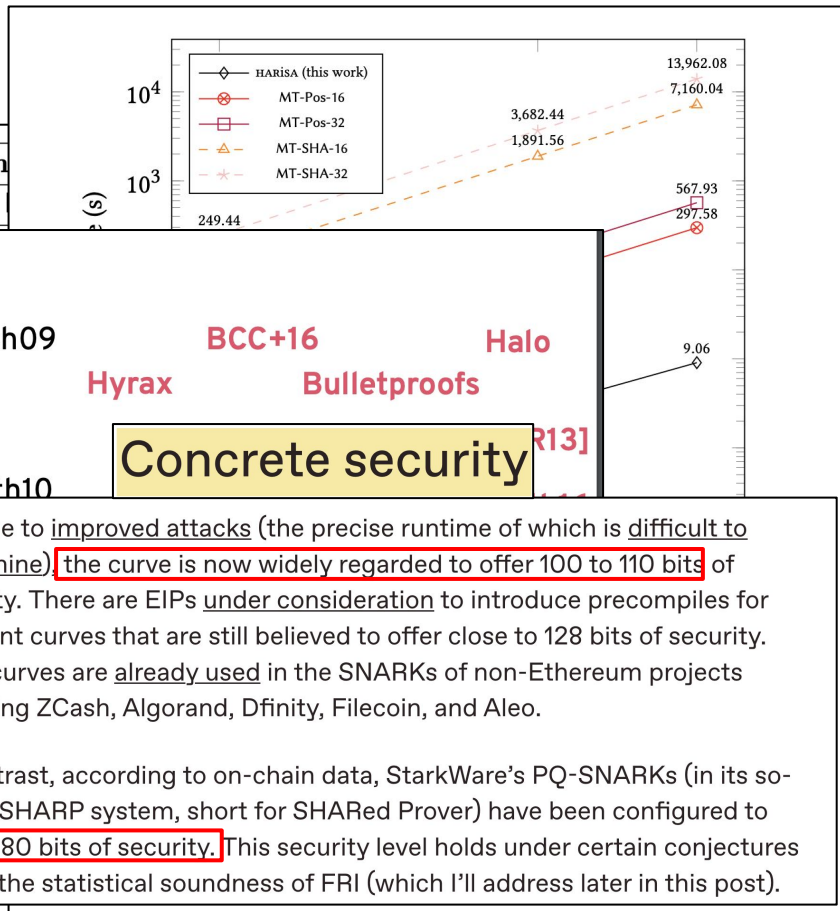

- Why comparing ZKPs? And what do we mean by that?
- Previous Proposals and State of Affairs
 - Spoiler on the state of affairs: *meh*.
- Let's Talk About *What Next*

Foreword

- This is an “opinion piece”
- Educated guesses on the state of affairs
- The ideas in here are just proposals
 - We want to hear your opinion and your better proposals

Comparing ZKPs

Comparing ZKP \approx {
 Blueprint (e.g. formal description)
 Artifact

 Efficiency
 Security/Assumptions

Comparing ZKP Systems at a glance: why and for whom?

- **For researchers**

- To *compare* their designs to existing ones
- To *critically assess* claims of published and submitted works

- **For practitioners**

- Who may be seeking out existing design/systems *to adopt*

- **For consumers of ZKP applications**

- Who want to *compare providers* by performance, security, potential, etc.
- (NB: major impact in rapidly expanding areas such as L2s based on validity proofs)

This is a hard problem, and not a new one ([BNTT20])

Community Proposal: A Benchmarking Framework for (Zero-Knowledge) Proof Systems

April 9, 2020

Abstract

This document proposes a partial framework for evaluating the concrete performance of proof and argument systems. The goals of this work are to: (1) summarize the challenges and subtleties inherent in any evaluation framework, (2) encourage quality and consistency in published evaluations, and (3) ease comparison of different proof and argument systems.

The proposal in this talk is mostly orthogonal to [BNTT20]

Community Proposal: A Benchmarking Framework for (Zero-Knowledge) Proof Systems

Main Challenges

Concept

Ide
func

Identify "functionalit

Benchmark

A *driver tool* which executes the proof systems with the requisite inputs (e.g., from the executions (e.g., 1

An *analysis tool*, which processes the machine-readable and human-readable outputs

Front-ends
producing IR

libSNARK

circom

Bellman

Mir

ZoKrates

Gepetto

snarky

zkInterface

Back-ends
consuming IR

Ligero

libSNARK

Bellman

Dalek
Bulletproof

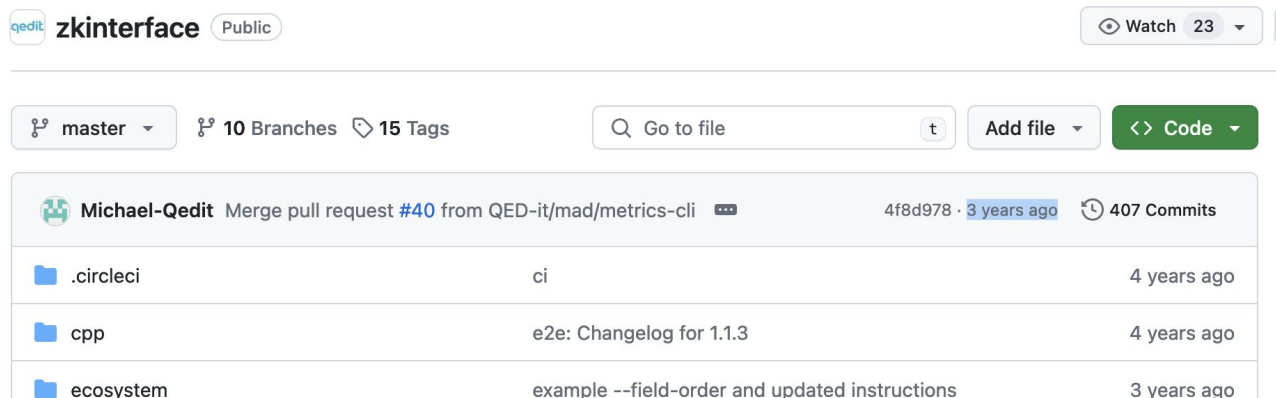

ZEXE

websnarks

Marlin

And then what happened??

Unfortunately, not much.

The screenshot shows the GitHub repository page for 'zkinterface' by Michael-Qedit. The repository is public and has 10 branches and 15 tags. The commit history shows a merge pull request #40 from QED-it/mad/metrics-cli, 4f8d978, 3 years ago, with 407 commits. The repository structure includes folders .circleci, cpp, and ecosystem.

Michael-Qedit Merge pull request #40 from QED-it/mad/metrics-cli 4f8d978 · 3 years ago 407 Commits

| | | |
|-----------|--|-------------|
| .circleci | ci | 4 years ago |
| cpp | e2e: Changelog for 1.1.3 | 4 years ago |
| ecosystem | example --field-order and updated instructions | 3 years ago |

...which brings us to this talk.

And today this issue might be even more pressing

with a big scalability boost: throughput 00x, and cost reduced to just 0.1% of L1.

- [Mantle](#) - Ethereum layer-2 network built with modular architecture delivering low fees and high security.
- [ZKSpace](#) - The ZKSpace platform consists of three main parts: a Layer 2 AMM DEX utilizing ZK-Rollups technology ZKSwap v3, a payment service called ZKSquare, an NFT marketplace called ZKSea.

```
$ citerus "SNARK" -y 2020
```

TL;DR of this Proposal

Call to arms:

Let's have a system/process that allows us to compare ZKPs systems at a glance;

Ideal result is unfeasible =>

Let's at least head towards *some ideal goal* while having *something imperfect* but good enough

A basic warm-up question to get to the ideal goal

We have a vague goal:

“Let’s have a system/process that allows us to compare ZKPs systems at a glance”

We have a vague notion of comparison:

Comparing ZKP \approx $\left\{ \begin{array}{l} \text{Blueprint (e.g. formal description)} \\ \text{Artifact} \\ \text{Efficiency} \\ \text{Security/Assumptions} \end{array} \right.$

Q: how does the community (at large) already describe and assess ZKPs?

The “academia–industry divide”

(what is available? How is it assessed?)

“Academic” ZKP Constructions:

- Have explicit security statements and proofs, constructions
- Are peer-reviewed by other experts
- May lack usable implementation

Deployed (“Industry”) ZKP Constructions:

- May be concretely used in practice
- Tend to be highly optimized
- Tend to be described informally in white papers; not peer-reviewed
- Rely on security audits with debatable effectiveness
 - Often enough, audits are not performed by experts in ZKPs

How does this inform us?

- *goal-wise*: should include bridging this gap
- *approach-wise*: meet in the middle; use strengths of two camps

The shape of the ideal goal

“What would this ideal goal *look like* (on the surface)?”

“What we need to make it work”

An “L2BEAT for ZKPs”

i.e., an homogeneous format for ZKP assessments + an interface for it

Requirements (?)

- Should be *lean* (not a standardization process)
 - But should be an *assessment*
- Should *incentivize* participation
- Should

| # | NAME | RISKS AND ASSUMPTIONS ⓘ | BRIEF SUMMARY ⓘ |
|---|----------------------|---|--|
| 1 | Boojum Era ⓘ |  | Recursion through FRI + Compression through PLONK |
| 2 | Groth16 (Arkworks) ⓘ |  | A Rust implementation of Groth16 |

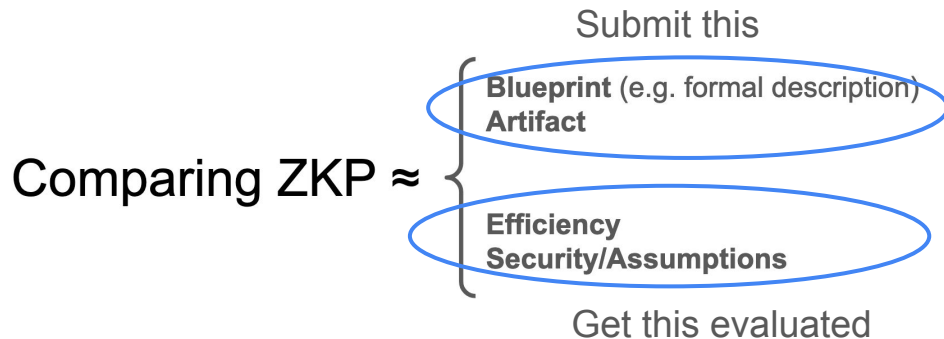

The underlying process

Proposal for a process: let's run it like a “lean” conference

- **Submitted entries are peer-reviewed**
 - Frequent rolling deadlines
 - Submission = specs (as concrete as possible) + artifact.
- **How is this different from an academic conference?**
 - *Different requirements* (wrt: formality, related work, novelty, artifacts)
 - *Living creature*: accept re-submissions with incremental improvements; encourage reuse of code and specifications

| # | NAME | RISKS AND ASSUMPTIONS ⓘ | BRIEF SUMMARY ⓘ |
|---|----------------------|---|--|
| 1 | Boojum Era 🏆 |  | Recursion through FRI + Compression through PLONK |
| 2 | Groth16 (Arkworks) 🏆 |  | A Rust implementation of Groth16 |

Incentives: why would anyone jump in?

- **Visibility:**

- Intuition: IF \$PLATFORM_NAME is the place to be THEN people will try to there
- possible if properly bootstrapped
- **Further possibility for incentives:** anyone can make a submission, not necessarily authors of the original work

- **Who would review and why?**

- Ideal reviewer profile *orbits* around “applied crypto expert”
- Mixture of people from university and industry
 - A little bit like the ZKProof workshop

| # | NAME | RISKS AND ASSUMPTIONS ⓘ | BRIEF SUMMARY ⓘ |
|---|----------------------|---|--|
| 1 | Boojum Era 🏆 |  | Recursion through FRI + Compression through PLONK |
| 2 | Groth16 (Arkworks) 🏆 |  | A Rust implementation of Groth16 |

Expected questions (and other loose ends)

- Q: *“Doesn’t it look like a f*%\$^@& nightmare to fairly compare ZKPs because...”*
 - *“... they could be efficient on setting A but not on setting B?”*
 - A: “Yes, true, but this is orthogonal to the main goal. First we’d settle on an imperfect set of comparison approaches.”
 - *“... they could be fast if parallelized but slow otherwise?”*
 - A: “Yes, true, but this is orthogonal to the main goal. First we’d settle on an imperfect set of comparison approaches.”
 - *“... they could be based on different intermediate representations and methodology?”*
 - A: “Yes, true, but this is orthogonal...”

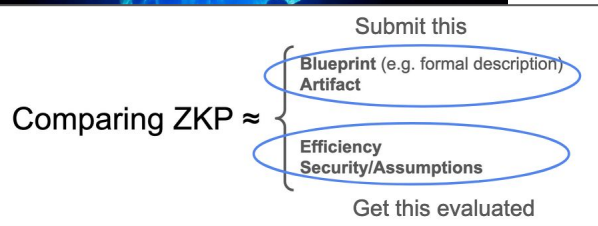

Wrapping up

- Finding ways to compare ZKPs at a glance is important and urgent
- It could look like *this* (image), but other solutions are possible
- **Q:** If not this design, then which one?
- **Q:** If this design, then how to bootstrap it? (without being paralyzed by the unavoidable rough edges?)

Thank you!

Peer-reviewed submissions

benchmarks

+

specification

Artifact evaluation

- Benchmark on one widely available cloud instance
 - Usual metrics (described in previous proposal)
 - GPU only if widely available
 - High-level black-box applications such as SHA256
 - Circuit implementation on top of Halo2+KZG
 - RiscV implementation on top of STARK wrapped in Groth16
 - Some manual review wrt to specification
-
- Can we catch unsound circuits that cheat to be faster?
 - What applications are relevant?

Review of specifications

Interface
